Examination and Evaluation Guidelines

DAVE3625 Introduction to Artificial Intelligence | Autumn 2026

This guide explains the structure, scope, evaluation and grading of the final examination. It does not contain examination questions or answers. Students should use it together with the course page and the material published in Canvas.

1 Examination details

Item	Information
Date	Friday 20 November 2026
Time	09:00-13:00
Form	Individual supervised digital school examination
Duration	4 hours
Permitted aids	None - the examination is closed book

2 Examination structure and scoring

- The examination contains approximately 80 questions and has a maximum score of 80 points.
- Most of the questions will be multiple-choice, with some allowing only one correct answer (radio buttons) and others allowing multiple correct answers (check boxes).
- There may also be some subjective, short-answer questions.
- The available points will be shown with each question in the examination system.
- Incorrect and unanswered questions receive 0 points unless partial credit is explicitly available.
- There is no negative marking.

3 Types of questions

The examination assesses understanding, application and interpretation. Questions may ask students to (but not limited to):

- recognise and explain important AI and machine-learning concepts;
- select an appropriate method for a short practical scenario;
- compare algorithms, evaluation measures, strengths and limitations;
- interpret a diagram, dataset, model output, metric or short Python code fragment;
- identify problems involving data quality, bias, overfitting or evaluation;
- reason about responsible use, limitations and societal consequences of AI; and
- Students will not be required to write code during the examination. Where relevant, an algorithm, code fragment or model output will be provided as part of the question. Students may be asked to interpret it, explain what it does, identify an error, or select the correct conclusion.

4 Examinable course content

The Canvas course page is the authoritative overview of the course content. All topics listed in the weekly teaching plan and the Course outline on Canvas are included in the examination, together with the related practical work and uploaded course material. Students should refer to the Canvas course page when planning their revision.

5 Reading and course resources

The following reading and course materials are included in the examination:

- Machine Learning Yearning: the chapters identified in the Canvas teaching plan;
- the selected sections, figures and summaries from the AI Index Report uploaded or announced in Canvas;
- other reading material uploaded in Canvas and identified as course material;
- lecture slides, practical notebooks and additional course notes published in Canvas; and
- the concepts and methods practised through the three mandatory assignments.

Elements of AI. Elements of AI is provided as a supporting reference and is not included as examination reading. Students will not be assessed on material that appears only in Elements of AI and is not covered by the included course material.

6 Evaluation guideline

Answers are evaluated according to the question type and the points shown in the examination system.

Question type	How it is evaluated
Single-answer questions	Full credit is awarded when the correct radio-button option is selected. An incorrect or unanswered question receives 0 points.
Multiple-answer questions	These questions use checkboxes. Unless the question states otherwise, full credit requires selecting all correct alternatives and no incorrect alternatives. An incomplete or incorrect combination receives 0 points.
Subjective questions	Answers are evaluated for factual correctness, relevant use of course concepts, reasoning or application, and clarity. Partial credit may be awarded when an answer demonstrates some correct understanding but is incomplete or contains a limited error.

Defective questions. If a question is found to be ambiguous or technically defective, it will be handled consistently for every candidate. Any adjustment will be documented in the examiner's guide.

7 Grade calculation

The final grade is based on the total number of points achieved. The following point boundaries will be used:

Grade	Points	Percentage	General result
A	72-80	90-100%	Excellent
B	64-71	80-89%	Very good
C	48-63	60-79%	Good
D	40-47	50-59%	Satisfactory
E	32-39	40-49%	Sufficient to pass
F	0-31	Below 40%	Fail

The letter grades are interpreted in accordance with the national qualitative descriptions used by OsloMet: A is an excellent performance, C is a generally good performance, E meets the minimum academic requirements, and F does not meet the minimum requirements.

8 Practical arrangements

Students must follow OsloMet's examination regulations and the instructions given by the examination administration and invigilators. Information about identification, attendance, permitted breaks, accessibility arrangements, the digital examination system and submission is governed by OsloMet's current examination procedures. Students are responsible for checking Studentweb and official examination information before the examination.
